

Lumalier Corporation has pioneered and applied engineered UV systems for air and surface applications since 1963.

The primary function of these products is to reduce the transmission of infectious disease in healthcare, educational, correctional, workplace, and group living environments.

Product efficiency benefits have a less than 24 month payback.

Recent ASHRAE guidelines have noted UV application to be a proven technology, and chapter 16 in the June, 2008 addition of the ASHRAE Handbook- HVAC Systems and Equipment, now, for the first time, covers “best practices” application of UV technology for HVAC systems.

This Chapter, co-authorized, by Mr. Chuck Dunn, President of Lumalier Incorporated, now recognizes UV systems as a viable disinfection technology. Copies of this chapter as well as an August, 2008 ASHRAE magazine article on ultraviolet germicidal irradiation are available on request.
